

Revation Systems Announces Increasing Customer Adoption with Financial Services and Regulated Data Centers

LinkLive 3.2 Enhancements for email authentication, advanced document collaboration and service bureau provisioning are increasing customer adoption.

MINNEAPOLIS/EWORLDWIRE/April 07, 2008 --- Revation Systems Inc., an emerging leader of innovative and secure unified communication software, today announced LinkLive 3.2 for customers in regulated markets and multi-tenant data centers. The latest release of this software is expected to be available for delivery in April, 2008. Major enhancements were designed by current LinkLive customers specifically for service bureaus.

"Email authentication and enhanced data center features were a natural extension to our compliant messaging capabilities," said Mark Pietras, CTO, Revation Systems. "Now e-mail can be authenticated using any online Web portal or e-commerce system, and data centers can host LinkLive for 1,000s of financial institutions all from a single server."

Revation's compliant unified communication server is designed for organizations in highly regulated industries that want to move customer interactions to lower-cost, self-service venues such as e-commerce sites, without losing personalized and knowledgeable service or sales opportunities. The LinkLive Suite provides a fully secure online communications environment for both internal and external electronic messaging, as well as advanced authentication options for web mail and chat.

"Revation's secure e-mail capability is exactly what we needed to protect customer information, and it integrated well with our existing e-mail applications," said Brad Emde, information security officer, KleinBank. "We've been using LinkLive for secure e-mail with thousands of customers and partners. Secure e-mail integration with online banking is a natural next step."

"It was pretty simple," stated Tim Pearson, RDSI Banking Systems. "With LinkLive, RDSI enabled its direct sales organization to sell more effectively by offering hosted secure e-mail as an add-on to our broad range of banking solutions. LinkLive's new Session Border Controllers designed specifically for e-mail and Web services, enables RDSI to meet security requirements and simplify customer provisioning."

"Revation's live chat and secure email have been a real win for our bank," said Mark Gabriel, network administrator, Premier Bank. "LinkLive's upcoming document collaboration and dynamic eFolders will be used by loan officers and business bankers."
